

This is a commercial offer to the management of your organization:

Dear colleagues,

On the web I came across your site and was pleasantly surprised to find out that there is somebody else who incorporates the knowledge and experience gained in the alternative medicine into the new biological and medicinal knowledge in the form of scientific articles. Let me state some of our achievements that we have published in several scientific articles:

1. We expanded the existing concept of homeostasis as the basis of everything alive and health:

<http://www.springerlink.com/content/40n5833400505423/?p=283ad6d1c1fc4eb5898b0b02f3890581&pi=12>.

2. We proposed a better than the conventional definition of psyche under rigid frames of existing knowledge and described mechanisms of the psyche functioning:

<http://www.springerlink.com/content/r262508p06481056/?p=c4c4e9065ef0420fbb8f3c0336e01f4b&pi=13>.

3. We described systematically the known natural rules (if not laws) in biology which can be applied to all living systems and which are necessary to maintain the mechanisms of homeostasis. These rules are indispensable in the development of the system approach to medicine:

<http://www.springerlink.com/content/r262508p06481056/?p=c4c4e9065ef0420fbb8f3c0336e01f4b&pi=13>.

4. In our last article we focused on the survey of the mechanisms of carcinogenesis: <http://www.springerlink.com/content/qg31053860710333/>. This particular issue is far from being solved and it remains one of the directions of our further research.

We are also actively involved in international congresses on space medicine and biology. The proposed approach to medical problems (including pharmacology) may be of interest for space researchers. Due to our scientific achievements, a new field of research in biophysics and medicine has developed (see press-conference in Moscow, 2002: <http://www.kotolupov.si/>). Our publications have already attracted attention of several eminent scientific and medical organizations in the world including the USA (http://www.kotolupov.si/?page_id=50).

At the end of the last year we submitted a proposal to Siemens and Sony Corps to take part in the manufacturing of an apparatus for measurement of mental state and adequacy of a human operator (see attachment Commercial Offer to Sony)

<<SONY commercial offer.docx>>

The knowledge of above mentioned biological rules gives us more options for the system approach in the research of causes and mechanisms of severe and so far incurable illnesses such as Alzheimer's disease, multiple sclerosis, cancer, mental diseases, various arthropathies, addictions, etc.

This new knowledge gives us a chance to avoid erroneous decisions contradicting the fundamental scientific facts at the stage of preliminary theoretical evaluation of

the patient's state which results in higher efficiency and lower costs of the treatment and also allows the development of new pharmaceutical products. Healthcare is not expensive because of its costly interventions but because of its inefficiency. There are no incurable illnesses there is only lacking knowledge of them. The country that would use this new knowledge would profit bigger economic opportunities.

Due to our specific status, namely we are not funded by any state institutions, we have no obligations towards them and we are forced to publish our findings without some important details (i.e. without know-how) in order to have a possibility to sell them in the future.

I think we have a good perspective in cooperation. I can see that our joint cooperation would result in increased effectiveness of our and your work. We could be shortly able to suggest a joint project to NASA NASA, aiming at the increase of physical and mental capacities of astronauts during long space travels, e.g. to Mars.

I can also see that we have a vast potential and several possible modes for cooperation: one of the possibilities is work under contract and we can be paid for the final result or we can act as your affiliated organization in Slovenia.

With best regards,
Viktor Kotolupov
